#### **Learning Objectives**

Ш	Understand the intuition of k-NN
	Understand how k-NN works
	Understand the mode specification of k-NN
	Understand the mode specification of k-NN Understand the mode specificat
	Understand precision and recall
	Understand precision and recall https://powcoder.com Understand the intuition of K-means
	Understand the loss function of Kareans and how it works
	Understand why and how to do random initialization for
	K-means

### Assignment Project Exam Help k-Nearestaleighbours Algorithm

Add WeChat powcoder

#### k-NN Classifier

k-Nearest-Neighbours is a classification algorithm that in order to determine the classification of a point, combines the classification of the k nearest points.

https://powcoder.com k-NN requires no distribution assumptions.

Add WeChat powcoder

It is a **supervised learning algorithm**: classify a point based on the known classification of other points.

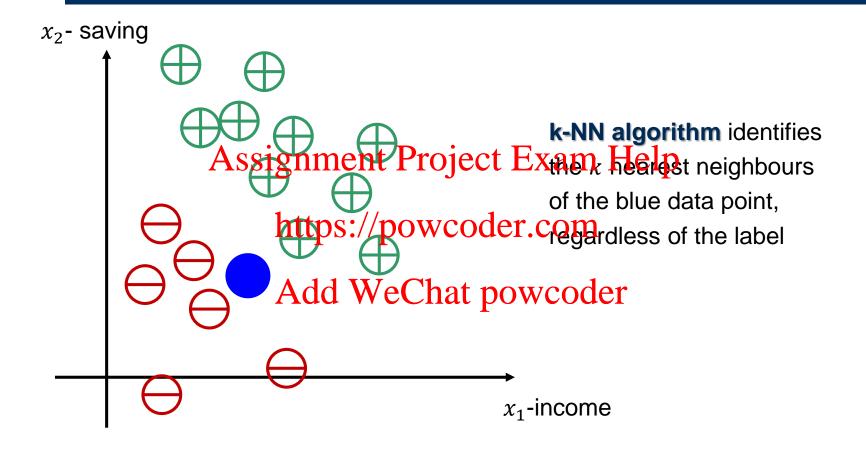

#### k-NN Classifier

#### How it works?

- ☐ Find k neasest neightewise of Exam Help
- □ Predict the class of x to be the majority class of the k nearest neighbours.

  Add WeChat powcoder
- ☐ Parameter k can be determined using validation.

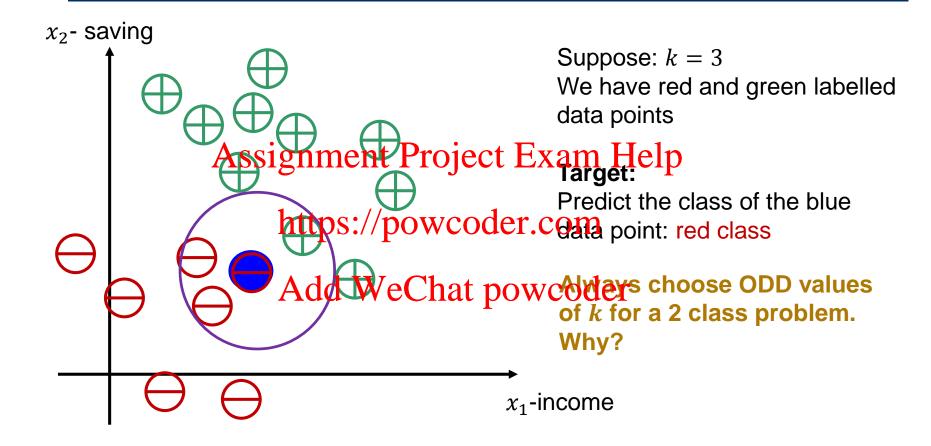

Training set:  $\mathcal{D} = \{(\mathbf{x}_1, t_1), (\mathbf{x}_2, t_2), (\mathbf{x}_3, t_3), \dots, (\mathbf{x}_N, t_N)\}$  where each  $\mathbf{x}_n = (x_{n1}, x_{n2}) = \text{(income, saving)}$  and  $t_n$  is  $\bigoplus$  or  $\bigoplus$ 

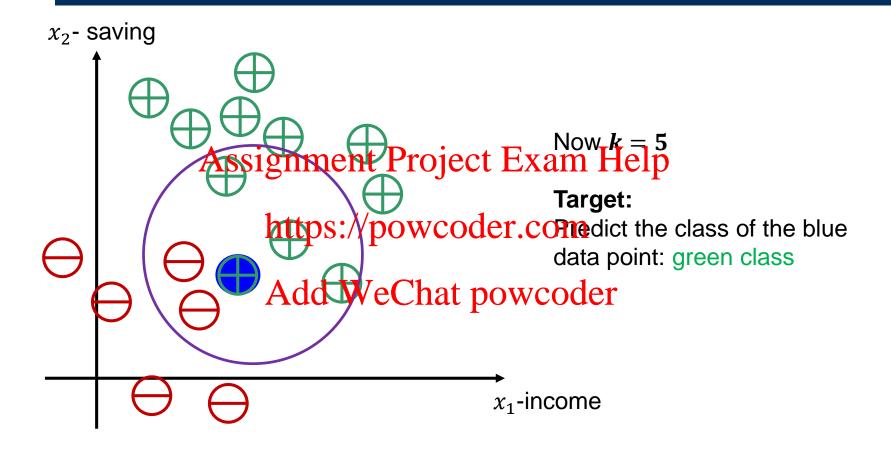

Training Set: 
$$\mathcal{D} = \{(\mathbf{x}_1, t_1), (\mathbf{x}_2, t_2), (\mathbf{x}_3, t_3), \dots, (\mathbf{x}_N, t_N)\}$$

Training Set: 
$$\mathcal{D} = \{(\mathbf{x}_1, t_1), (\mathbf{x}_2, t_2), (\mathbf{x}_3, t_3), \dots, (\mathbf{x}_N, t_N)\}$$

Training Set: 
$$\mathcal{D} = \{(\mathbf{x}_1, t_1), (\mathbf{x}_2, t_2), (\mathbf{x}_3, t_3), \dots, (\mathbf{x}_N, t_N)\}$$

#### k-NN Model

This is a nonparametric model. There is no need for parameter estimation.

Training Set: 
$$\mathcal{D} = \{(\mathbf{x}_1, t_1), (\mathbf{x}_2, t_2), (\mathbf{x}_3, t_3), \dots, (\mathbf{x}_N, t_N)\}$$
Assignment Project Exam Help

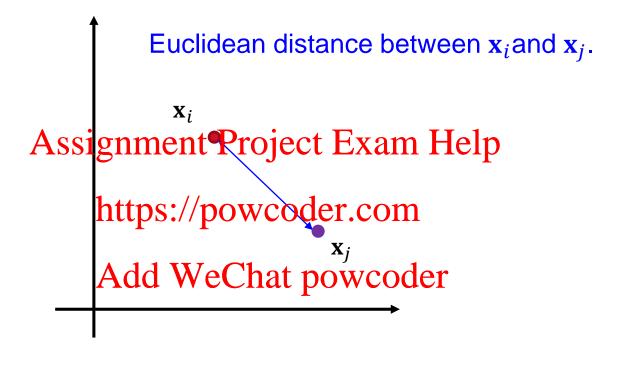

https://powcoder.com
The model is defined as
Add WeChat powcoder

$$f(\mathbf{x}, \beta) = \text{Mode}\{\mathbf{x}_n \in N_k(\mathbf{x}) \text{ where } \mathbf{x}_n \in \mathcal{D}\}$$

where  $N_k(\mathbf{x})$  is the neighbourhood of  $\mathbf{x}$  defined by  $\mathbf{k}$  closest points in the training dataset, and Mode() is the Mode function (regarding  $t_n$  values of  $\mathbf{k}$  closest points).

#### k Closest Points

$$\|\mathbf{x}_i - \mathbf{x}_j\| = \sqrt{(\mathbf{x}_i - \mathbf{x}_j)^T (\mathbf{x}_i - \mathbf{x}_j)}$$

There are other distance measures can be used.

#### The k-NN prediction rule for regression:

For a new point  $\mathbf{x}_0$ , the model predicts the value at  $\mathbf{x}_0$  as the average scalar like phenomenant  $N_k(\mathbf{x}_0)$ 

https://powcoder.com

#### The k-NN prediction relief to Pelassification:

For a new point  $\mathbf{x}_0$ , the model predicts the class of  $\mathbf{x}_0$  as the majority vote (mode) among the k neighbours in  $N_k(\mathbf{x}_0)$ .

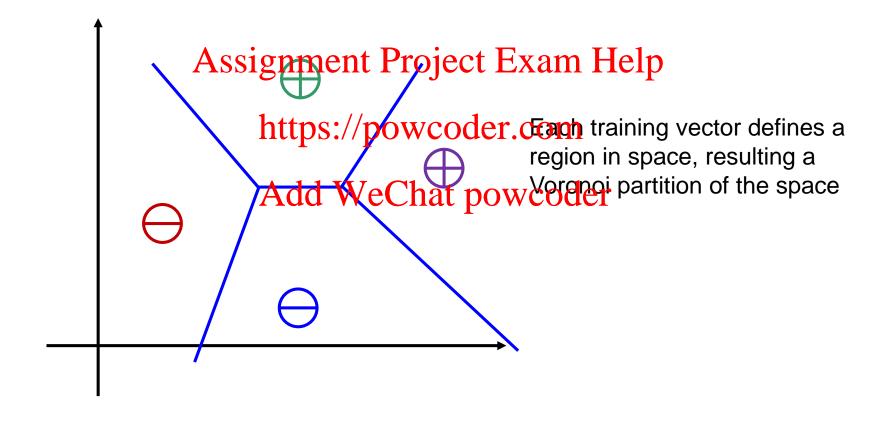

#### k = 1, 1-Nearest-Neighbor

- □ x is one of training data, then who are the neighbourhood? x is its own neighbourhood.
- $\Box \text{ If } k = 1, \text{Aseigns for the line of the line$
- ☐ 1-NN is more accurate on the training data, while causing overfitting problem. The algorithm is also quite sensitive to outliers.
- ☐ "kernel" methods (later in the course) use a generalized notion of neighbourhood but are in essence same thing as k-NN.

#### k = 1, 1-Nearest-Neighbor

Always choose ODD values of *k* for a 2 class problem.

k cannot be a fautified of the number of class, to avoid a tie when assigning class wooder.com

Add WeChat powcoder

# Assignment Project Exam Help Loss: Junction for classification/Genfusion matrix

#### k-NN Objective

#### The misclassification rate is:

- The target of k-Nhttps://powcoder.com
- Minimize number of misclassification of training set? This can be minimized at k = 1. Might not the good way. Oder
- There is a k for which bias and variance are balanced optimally.
- How to decide k?
- We can still incorporate the model and features techniques, including training & validation & test sets, CV, etc, to see which k is the best regarding the target metrics, e.g. misclassification rate.
- Is misclassification rate always a good metric for all applications?

#### **Skewed Data**

- In the customer default example, we predict t =1 if default, and t = 0 if not default.
- Suppose Asing og starte presistor of xann algorithm, we get 99% accuracy rate, or 1% misclassification rate (error rate). https://powcoder.com
- In reality, there is approximately 0.5% customers would default (t = 1). Add WeChat powcoder

Is this a good classifier / machine learning model?

- What if we build a simpler classifier that predicts everyone to be t = 0 (not default)?
- This classifies ignimental expect residential for rate.
- Is it a better classifier.?/powcoder.com

Add WeChat powcoder

**Skewed data!** 

#### **Confusion Matrix**

		Predicted values						
		0 (-)						
Actual value	0 (-) Ass	True negative (TN) signment Project Exa	False positive (FP) am Help					
	1 (+) False negative (FN) https://powcoder.co		True positive (TP)					

t=1 represents the rare class that we want to capture, e.g. default

The recall, or sensitivity rate, or true positive rate (TPR) is:

$$TPR = \frac{TP}{TP + FN} = \frac{TP}{Total \# of ACTUAL Positives}$$

Second ROW sum of the confusion matrix

For **all customers who actually** default, what is the percentage that we correctly predicted as t = 1 (default). Higher the better.

#### The precision (positive predictive rate) is:

For all customer we prepare the percentage of them who actually default. Higher the better.

Add WeChat powcoder

Why not build a simpler classifier that predict everyone to be t = 0 (not default)?

The recall will be 0=> to avoid cheating

We check both precision and recall instead of just evaluating one.

#### **Confusion Matrix**

- □ Recall how good a test is at detecting the positives. A test can cheat and maximize this by always returning "positive".

  Assignment Project Exam Help
- Precision how many of the positively classified were relevant. A test can cheat and maximize this by only returning positive wheoher result it is most confident.
- ☐ The cheating is resolved by looking at both metrics instead of just one.

t actual	0	0	0	0	0	1	0	1	0	0
•	1 Assio							1	1	1
t predicted-2	Assig			J		-	0	0	0	0
https://powcoder.com										

Calculate the precision and recall for each modeler

#### **Precision and Recall Tradeoff**

t actual	0	0	0	0	0	1	0	1	0	1
t predicted-A	0	1	1	1	1	1	1	1	1	1
t predicted-B	0	0	0	0	0	0	0	1	0	0

For model A: Assignment Project Exam Help

NOT that confident, e.g. low probability

threshold of logistic lettression powcoder. Pogision

Recall=3/3= 100%

Precision=3/9=33.32%dd WeChat powcoder

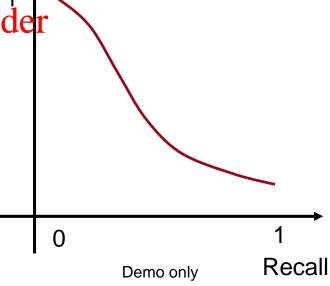

High recall, low precision.

For model B: we only predict t =1 only if we are VERY confident, e.g. high probability threshold of logistic regression

Recall= 1/3= 33.33%.

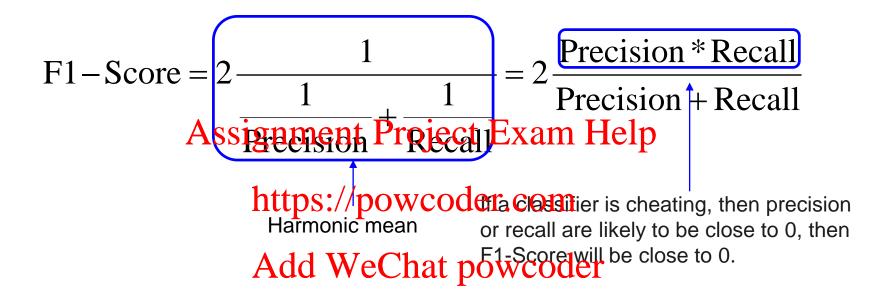

**Precision=1/1=100%** 

Low recall, high precision,.

#### F1-Score

#### To evaluate a classifier:

- Incorporate the model and feature selection techniques, including training & validation & test sets and CV
- > Evaluate misclassification rate, precision & recall and F1-Score.

#### Other Measures for Binary Classifiers

☐ The confusion matrix for a binary classifier again

		Predicted values					
	<u>Ąs</u> si	o (-) gnment Project l	1 (+) Exam Help False positive (FP)				
values	1 (+)	False negative (FN) https://powcode	True positive (TP)				

- Define the true positive rate (TPR) and the false positive rate (FPR)  $Add_{TP} WeChat powcoder_{FP}$   $TPR = \frac{TP}{TP + FN} \quad \text{and} \quad FPR = \frac{FP}{FP + TN}$
- Both jointly assess the performance of a classifier. The best case would be a higher TPR and a lower FPR. This means the classifier wont make many errors on positive and negative examples, respectively

#### Receiver Operating Characteristic (ROC)

- □ Receiver Operating Characteristic (ROC) metric to evaluate classifier output quality. Particularly useful for binary classification classifiers
- ROC curves typically feature true positive rate (TPR) on the Y axis, and false positive rate on (FPR) the X axis. This means that the top left corner of the plot is the "ideal" point a false positive rate of zero and a rive positive rate of one.
- This is not very realistic, but it does mean that a larger Area Under the Curve (AldC) Schalty (Better Oder)
- □ ROC curves are typically used in binary classification to study the output of a classifier. In order to extend ROC curve and ROC area to multi-class or multi-label classification, it is necessary to binarize the output. One ROC curve can be drawn per label.

#### Receiver Operating Characteristic (ROC)

Take logistic regression classifier as an example ☐ For all the test/validation examples, the logistic regression model produces the probability for each case/example to be class A (or Class 1). ☐ A typical decisions in the probability for search is larger than 0.5, then we classify the case as Class A (or Class 1), otherwise Class Bttpsc/aggycoder.com ☐ Why do we use 0.5? In fact, taking a threshold between 0.0 and 1.0, we can make we sight as ewo put the same training model. ☐ For each threshold between 0.0 and 1.0, we can have decisions over all the examples, then we can construct a confusion matrix, then we can calculate TPR and FPR, and finally draw a point on the coordinates.

#### **ROC: Example**

- ☐ In test dataset:100 positive cases (Class 1) and 100 negative cases (Class 0)
- ☐ Take threshold as 0.0, then all the testing cases will be classified as positive. Why? Hence TPR=1.0 and FPR=1.0
- Take the threshold as 1.0, when all the testing cases will be classified as negative. Why? Hence TPR=0.0 and FPR=0.0 https://powcoder.com
- ☐ Threshold = 0.25 produces TPR=0.9 and FPR=0.60 Add WeChat powcoder

Thres	hoold	Predicted				
=0.25		0 (-)	1 (+)			
<b>Test</b>	0 (-)	40	60			
True Test	1 (+)	10	90			

#### **ROC: Example**

☐ Threshold = 0.50 produces TPR=0.80 and FPR=0.20

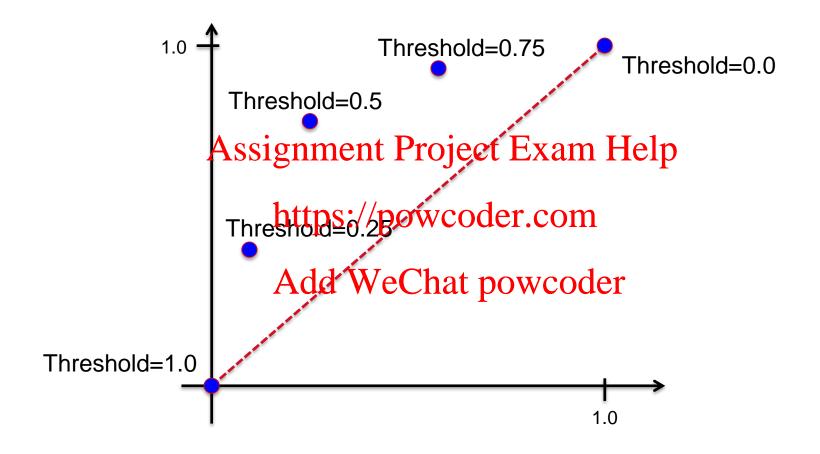

Threshool	Predicted					
d =0.50	0 (-)	1 (+)				
Assighme	ent <b>Pf</b> ojec	t Exa <del>rl</del> Help				
1 (+) https	://powcod	ler.com				

☐ Threshold = 0.754pdedtwesclipe=904@endep=0.10

Thres		Predicted				
d =0.7	70	0 (-)	1 (+)			
<b>Test</b>	0 (-)	90	10			
True Test	1 (+)	60	40			

#### **ROC: Example**

☐ This finally gives us the ROC. sklearn can automate the process of finding ROC. See Lecture 04\_Example 00.py

## K-means

K-means is a clustering algorithm that tries to partition a set of points into K sets (clusters) such that the points in each cluster into the header that the points in each cluster in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the header that the points in the leader to the leader that the points in the leader to the leader that the points in the leader that the l

https://powcoder.com

It is a unsuperxised learning algorithm, since data are not labelled.

# K-means Input

**K** (number of clusters)

Training Assignment Rroject Exam Help

https://powcoder.com

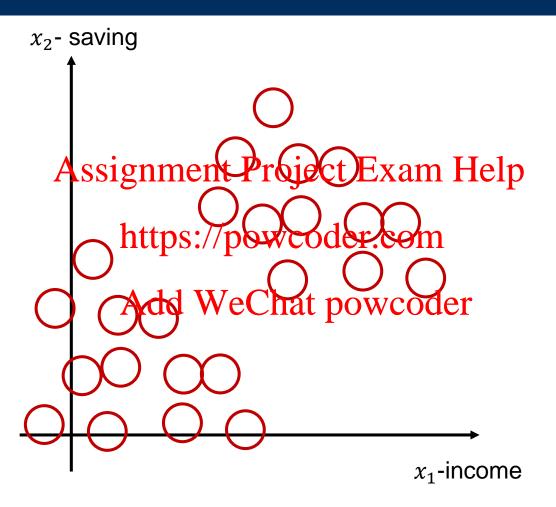

How to choose *K*? Add WeChat powcoder How to select the starting values of cluster centroids?

K-Means is an iterative algorithm and it contains **two** steps.

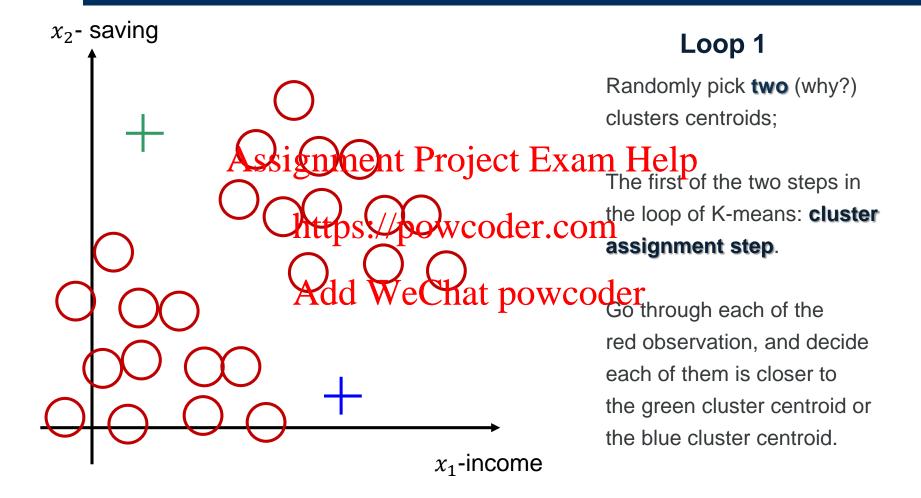

- i. cluster assignment step
- ii. centroid move step.

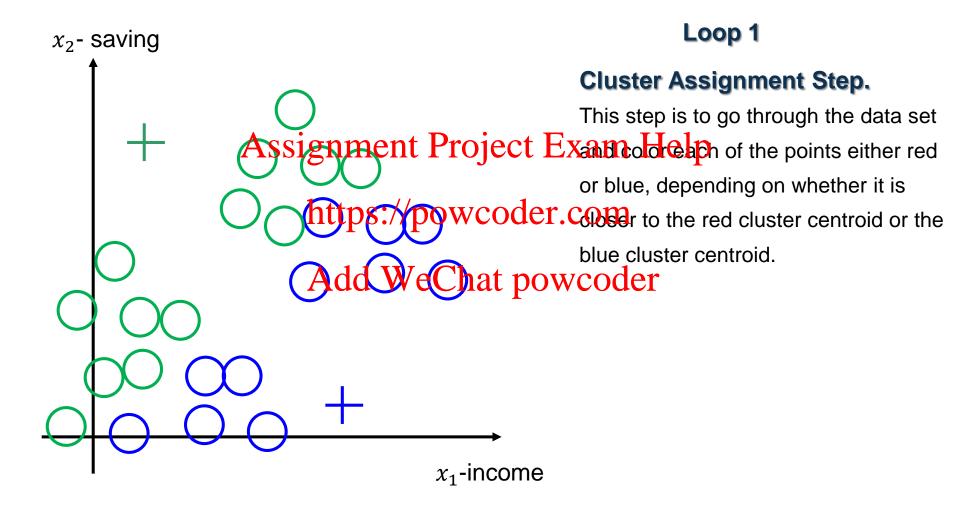

# **How K-means work**

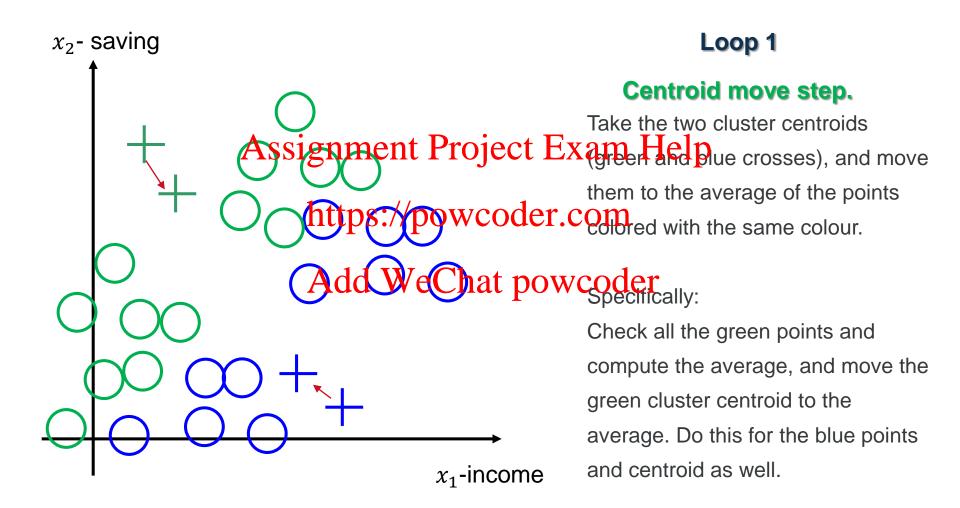

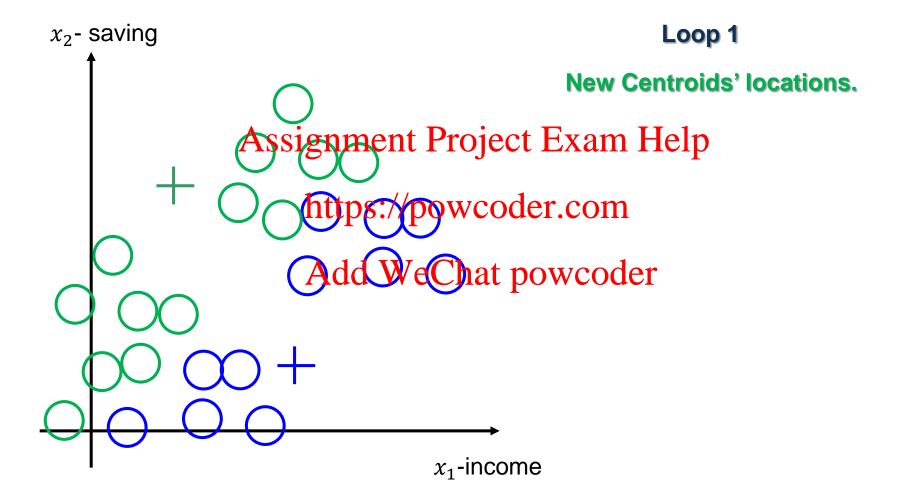

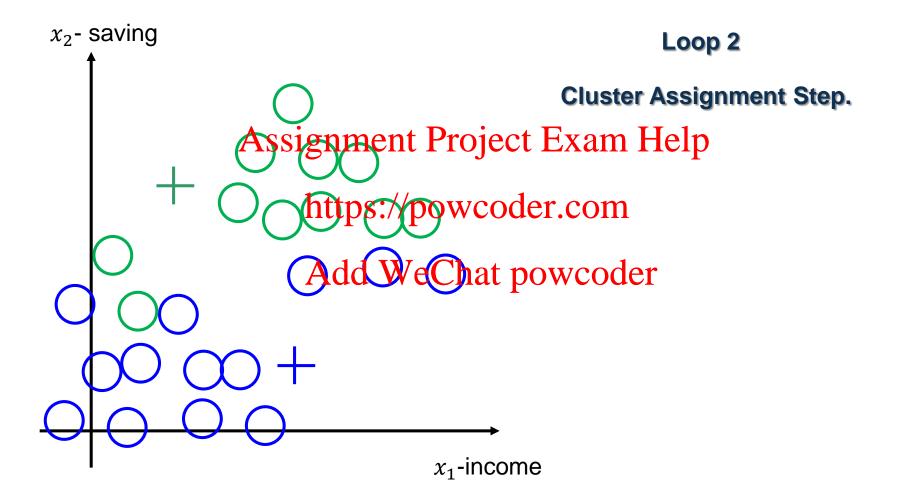

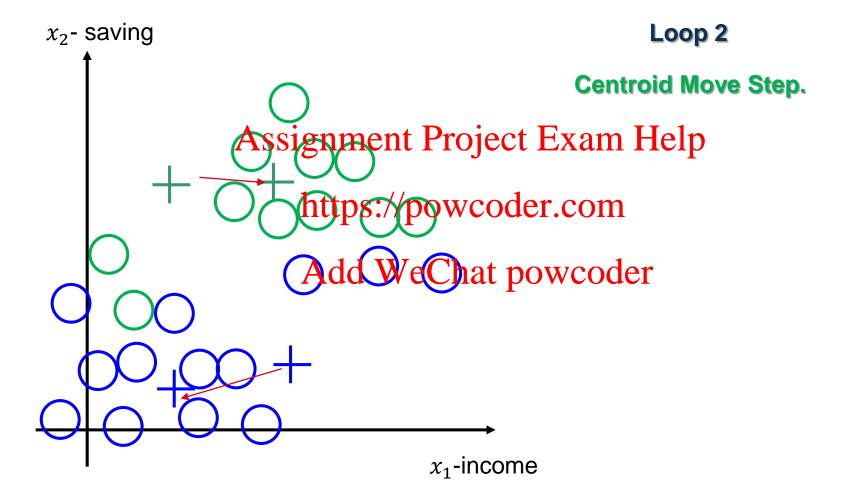

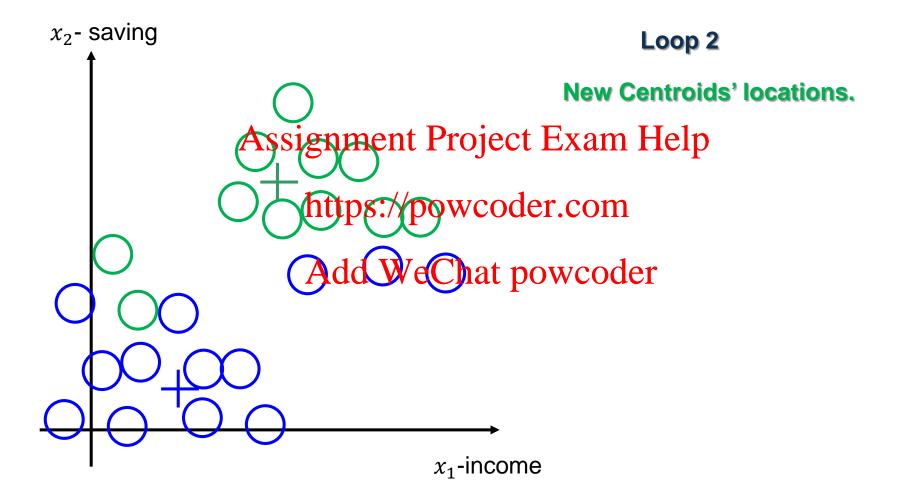

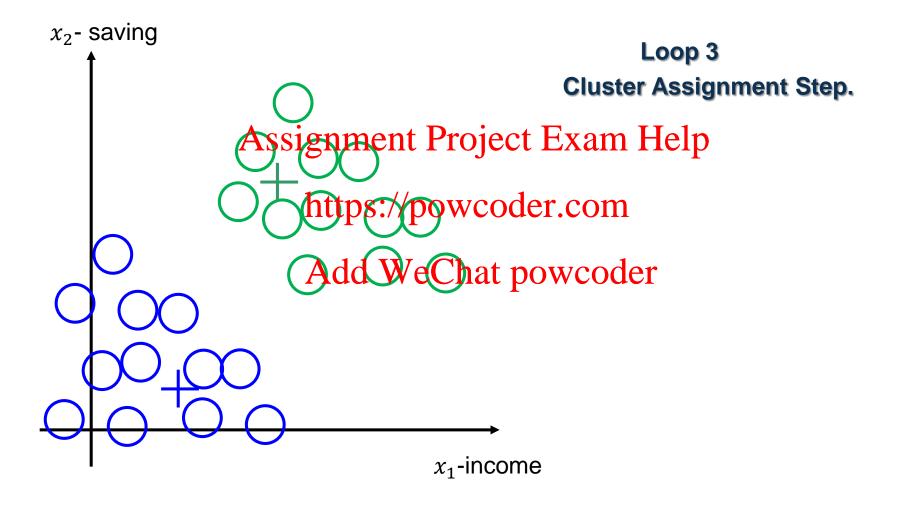

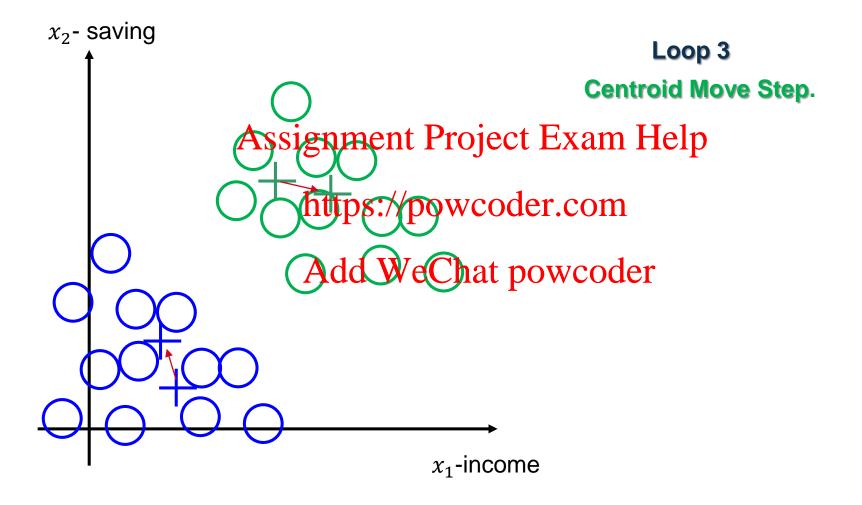

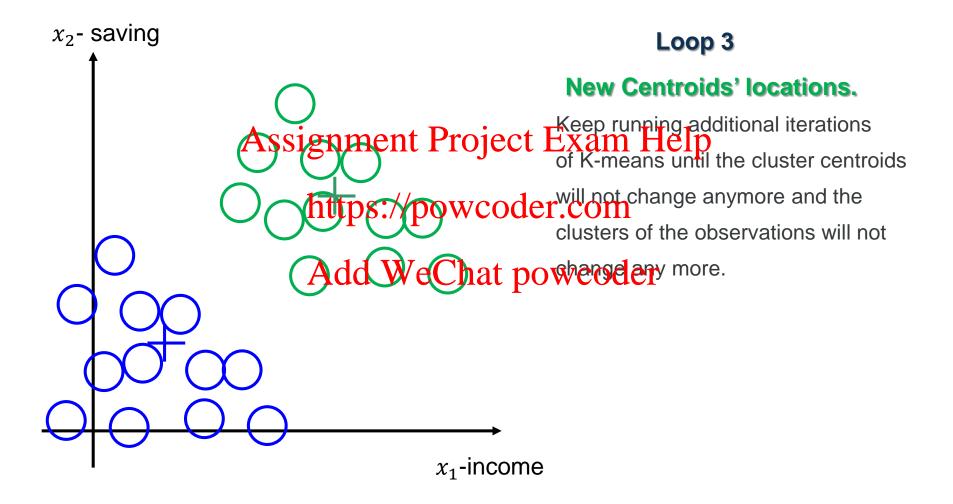

## **K-means Loss Function**

 $C_n$ : the index of clusters (1,2,...,K) to which data point  $\mathbf{x}_n$  is assigned (at the moment)

 $\mu_k$ : cluster centroid k. Total number of clusters: K.

 $\mu_{C_n}$ : cluster centroid to which data point  $\mathbf{x}_n$  was assigned.

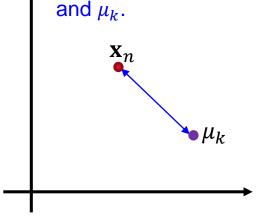

Suppose  $\mathbf{x}_n$  is allocated to cluster 2 ( $C_n = 2$ ), then  $\mu_{C_n} = \mu_2$ 

https://powcoder.com Loss function (distortion): to be minimized

Add WeChat powcode  $\mathbf{x}_n$  clidean distance between  $\mathbf{x}_n$ 

$$L(\beta) = \sum_{n=1}^{N} ||x_n - \mu_{C_n}||^2$$

**β**: index of clusters and cluster centroids

# K-means Algorithm

Randomly initialize K cluster centroids,  $\mu_1, \mu_2, \mu_3, ..., \mu_K$ 

Loop the two step process until converge:

#### Cluster Assignment Step.

Assign the observations  $x_n$  to the diosest centroid

https://powcoder.com In this step, we fix  $\mu_1, \mu_2, \mu_3, \dots, \mu_K$ , and aim to minimize the loss function  $L(\beta)$  with respect to  $G_1, C_2, C_3, \dots, C_N$ .

#### Centroid Move Step.

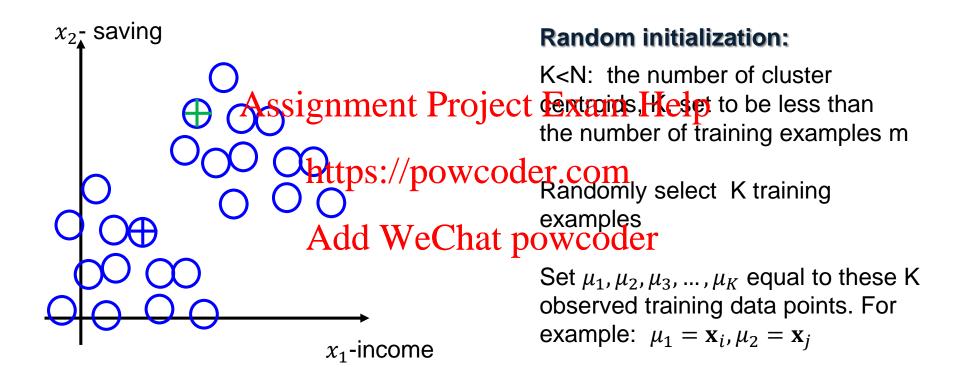

for *k* in 1:K

 $\mu_k$ : mean of the data points assigned to cluster k => as the new cluster centroid

In this step, we fix  $C_1, C_2, C_3, ..., C_N$ , and aim to minimize the loss function  $L(\beta)$  with respect to  $\mu_1, \mu_2, \mu_3, ..., \mu_K$ .

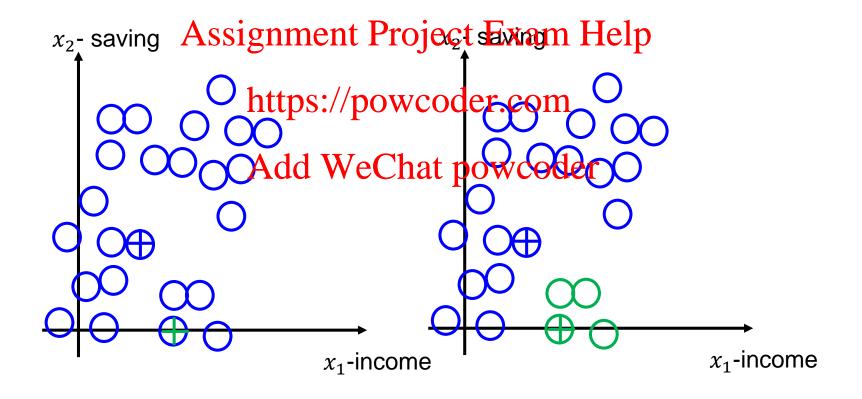

## How to initialize the K-means?

What if the random initialization gives us the following starting centroids. It is possible the algorithm falls into the **local optima**.

## How to deal with local optima problem?

Repeat the random initialization for *T*, e.g. 100, times

For each initialization: Assignment Project Exam Help

• Run the k-means algorithm, and record loss function  $L(\beta)$  values

Add WeChat powcoder

• Pick the initialization that produces the lowest  $L(\beta)$ 

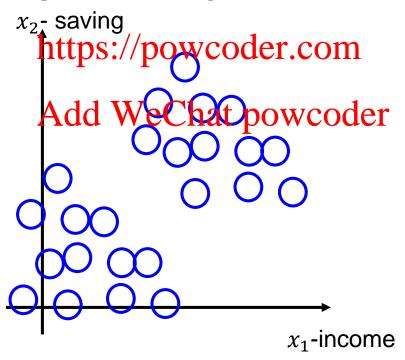

## **How to choose K?**

### No agreed way

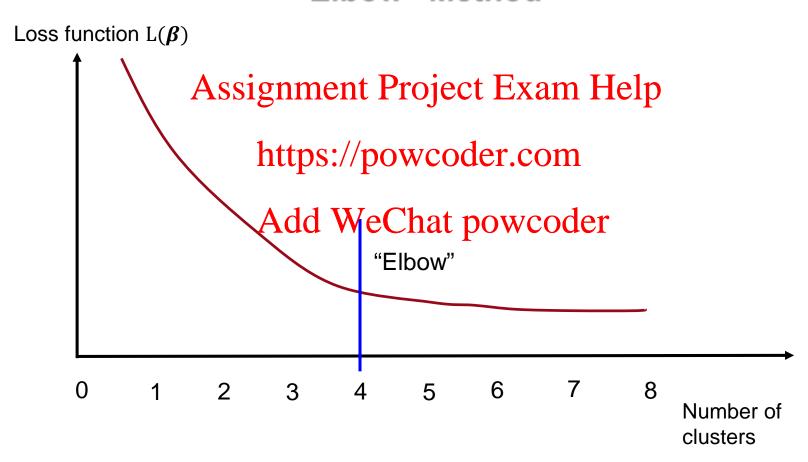

Consider your application based on the real world scenario, e.g. clustering the female and male customers (K=2 is good); clustering the size of shoes (K=2 is not a good choice).
